

KOYEB DEPLOYMENT GUIDE

Complete Step-by-Step Tutorial to Deploy ShowPay Full-Stack App Live

1. Why Koyeb & How It Works

Koyeb is a high-performance serverless cloud platform. Your ShowPay project has been engineered to run both the Node.js Backend API and the React Frontend UI from a single unified Koyeb service.

- Root package.json automatically installs both backend and frontend dependencies via postinstall.
- Express server automatically serves the compiled static React app from frontend/dist.
- Zero CORS errors and zero 404 Vercel routing issues!

2. Step-by-Step Live Deployment Steps

Step 1: Create Koyeb Account & Connect GitHub

1. Go to <https://www.koyeb.com> and log in with your GitHub account.
2. Click on the "Create Web Service" button on the dashboard.
3. Select "GitHub" as the deployment method and pick your repository: mathurmonu62-rgb/showpay.

Step 2: Configure Build & Execution Settings

Koyeb will automatically detect your Node.js environment from package.json.

- Build Command: Koyeb automatically runs `npm install` and `npm run build`.
- Start Command: Koyeb automatically runs `npm start` (which triggers `node server.js`).
- Port: Leave the default port or set it to 8080 (Koyeb injects the `PORT` environment variable).

Step 3: Enter Environment Variables (CRITICAL)

In the "Environment variables" tab on Koyeb, add the following key-value pairs:

PORT	= 8080
JWT_SECRET	= showpay_jwt_secret_key_2024_very_secure
SUPABASE_URL	= https://fuqdoqqoagtlmcqpslkg.supabase.co
SUPABASE_SERVICE_KEY	= sb_publishable_vpExmZZBdY9v5410CmFA2Q_Ik2iKVic
ADMIN_EMAIL	= admin@showpay.com
ADMIN_PASSWORD	= admin@0123

Step 4: Click Deploy & Launch Live

1. Click the green "Deploy" button at the bottom.
2. Koyeb will provision a secure container, build your React frontend, start your Express backend, and provide a secure HTTPS URL (e.g., <https://showpay-app.koyeb.app>).
3. Open your new URL, log in, and enjoy your fully functional full-stack live application!
